| Sales Mode                  | Unique license | Subscription    | Subscription    |

(1) A set of recommendations are described in both User Guide and Administrator Guide. They give guidelines for the software setup and configuration in sensitive or confidential environment.

(2) Advanced PKI Options are a set of functions and parameters which allow the automatic integration of the software within an existing PKI : Automatic Identification of smartcard readers, automatic certificate selection, handling of full certification chain, etc...

(3) The USB Mode allows to store the VPN Configuration on a removable media. With the certified VPN Client, this function is securized with a systematic signature of the configuration. This release also allows to disable the USB Mode.

(4) VPN Configuration management mechanisms (import, export) are handled by a process running in system mode, which cannot be hacked in user mode.

(5) Automatic Mode enables the software to negotiate algorithms with the gateway. This mode is not allowed in the Certified version in order to limit cryptographic embrittlement.

(6) Both VPN PREMIUM and VPN Certified come together with a personalized support, which allows dedicated monitoring for fast and efficient priority management.
